*Election/Restrictions*

Restriction to one of the following inventions is required under 35 U.S.C. 121:

- I. Claims 1-8, 15, and 16, drawn to a method for detecting cell-proliferating diseases characterized by determining the methylation level of cytosine residues, classified in class 435, subclass 6, encompass a distinct invention defined by a target nucleotide sequence (sequence ID number 4).
- II. Claims 1-5, 10-12, 15, and 16, drawn to a method for detecting cell-proliferating diseases characterized by determining the methylation level of cytosine residues, classified in class 435, subclass 6, encompass a distinct invention defined by a target nucleotide sequence (sequence ID number 8).
- III. Claims 9 and 17-23, drawn to a pair of DNA primers, classified in class 536, subclass 24.33, encompass two distinct inventions each defined by a nucleotide sequence (sequence ID numbers 1 and 2).
- IV. Claims 13 and 24-29, drawn to a pair of DNA primers, classified in class 536, subclass 24.33, encompass two distinct inventions each defined by a nucleotide sequence (sequence ID numbers 5 and 6).

Art Unit: 1634

Inventions I and II are unrelated. Inventions are unrelated if it can be shown that they are not disclosed as capable of use together and they have different modes of operation, different functions, or different effects (MPEP § 806.04, MPEP § 808.01). In the instant case the different inventions are defined as having distinct target nucleotide sequences upon which the method is to be performed. The nucleotide sequences are structurally distinct chemical compounds and are unrelated to one another. These sequences are thus deemed to normally constitute independent and distinct inventions within the meaning of 35 U.S.C. 121. Absent evidence to the contrary, each nucleotide sequence is presumed to represent an independent and distinct invention, subject to a restriction requirement pursuant to 35 U.S.C. 121 and 37 CFR 1.141.

Inventions III and IV are unrelated. Inventions are unrelated if it can be shown that they are not disclosed as capable of use together and they have different modes of operation, different functions, or different effects (MPEP § 806.04, MPEP § 808.01). In the instant case the different inventions are defined as having distinct target nucleotide sequences upon which the method is to be performed. The nucleotide sequences are structurally distinct chemical compounds and are unrelated to one another. These sequences are thus deemed to normally constitute independent and distinct inventions within the meaning of 35 U.S.C. 121. Absent evidence to the contrary, each nucleotide sequence is presumed to represent an independent and distinct invention, subject to a restriction requirement pursuant to 35 U.S.C. 121 and 37 CFR 1.141.

Inventions I and II are related to inventions III and IV as product and process of use. The inventions can be shown to be distinct if either or both of the following can be shown: (1) the process for using the product as claimed can be practiced with another materially different product or (2) the product as claimed can be used in a materially different process of using that

product (MPEP § 806.05(h)). In the instant case the diagnostic method (process of use) described in claim groups I and II could be performed with a number of different primers (products) with equivalent results despite the differences in the DNA sequences of the primers.
